Terms of Reference

TERMS OF REFERENCE FOR THE PROCUREMENT AND MONITORING OF UTHUKELA, UGU, ILEMBE, AND JOE GQABI DISTRICT MUNICIPALITIES FLOOD DISASTER PROJECTS (INSTALLATION OF SOLAR BOREHOLES)

1.INTRODUCTION

On 18 April 2022 a national state of disaster was declared in response to the widespread flooding due to high rainfall in Eastern Cape (EC) and KwaZulu Natal (KZN) Provinces. While all parts of the EC and KZN provinces were impacted, the worse-hit areas were the eThekweni metro and the districts of iLembe, uGu, King Cetshwayo, uThukela, uMgungundlovu, Alfred Nzo and Joe Gqabi. It is estimated that billions were lost by the two economies as KZN couples the aftereffects of the July 2021 riots with the flood disaster within a space of four months.

The declaration was pursued in terms of Section 23 of the Disaster Management Act, 2002 since the affected municipal areas reflected and intensified on the following characteristics:

- Poor / no access to basic services, such as electricity, water, sanitation, and solid waste removal
- Unreliable or dysfunctional infrastructure for the provision of water and sanitation services
- Poverty and poor socio-economic conditions
- Public spaces, such as hospitals, clinics, schools, and pension payout points do not have access to water and proper sanitation services.
- Highly densified areas, and
- Shortage of shelter and ablution areas.

Government in the Joint Operational Committees / Task Teams including the private sector and NGO have flagged humanitarian support as the greatest need in the disaster recovery plans and meetings.

DBSA support is targeted at providing humanitarian relief in indigent communities as well as low income / rural areas with minimum standards of basic services access and a poor quality of life. The support is intended to support government's plan and contribute towards:

- a) restoring dignity of communities through access to basic water services,
- b) facilitating community mobility and connectivity, and
- c) encouraging sustainable replacement housing that improves the quality of life of beneficiaries.

The successful implementation of the infrastructure projects is expected to contribute significantly to the achievement of three of the South African Government national outcomes namely:

- a) Outcome 6: An efficient, competitive, and responsive economic infrastructure network.
- b) Outcome 8: Sustainable human settlements and an improved quality of household life.
- c) Outcome 9: A responsive, accountable, effective, and efficient local government.

2.BACKGROUND

Business and government stakeholders extended engineering capacity augmenting the District Disaster Management Centers to undertake assessments and costing of the various categories of infrastructure in affected municipalities. Three engineers from the EC PMU and at the DDM district hub supported the Eastern Cape Provincial Disaster Management Teams with the technical assessments of infrastructure and determination of reasonableness of costing in the various districts

In lieu of the Disaster, Government has approached the DBSA with a request to support with the provision of Basic Services to the identified hotspots. EXCO have approved that the DBSA supports the Government on the following interventions to eradicate the impact of the floods.

- Provision of water services in the form of boreholes

3.TOP INTERVENTION AREAS IDENTIFIED

To eradicate the impact of the floods in the identified areas, the Joint Operational Committees / Task Teams including the private sector and the DBSA, provinces and municipalities have identified the following interventions:

- Drilling, equipping and refurbishment of boreholes as well as ensuring water quality compliance and ensure provision of potable water) (SANS 205)
- Repairs and installation of borehole equipment affected by the floods.
- Refurbishment of Water Treatment Works.

4.OBJECTIVE

It is expected that the DBSA's support with the implementation of some of these interventions, will address some of the province's shortcomings.

The key objectives and deliverables are:

- i.Drilling, supply, and installation of Boreholes and /or

ii.Repair and refurbishment of Bore holes.

5.TIME FRAME

The expected timelines for this programme will be dependent on the type of intervention to be undertaken in the implementation of the short-term interventions identified as the scope encompasses the refurbishment of existing works and new installations. The project durations will be stated under the relevant project scope of work for each type of intervention.

6.SCOPE OF WORK

To support the communities in the identified flood affected areas, the scope of work for the programme needs to be undertaken to mitigate:

- High shortage of drinking water i.e., Solar Boreholes and water storages.
- High number of dysfunctional boreholes due to flood impact.
- Affected electricity facilities to support the operations of boreholes
- High number of dysfunctional water pumps which require replacement

The detailed scope for each intervention is indicated in Table 1 below.

9.SCOPE OF WORK

9.1. CONSTRUCTION AND/OR REFURBISHMENT OF BOREHOLES:

9.1.1. METHODOLOGY AND SPECIFICATION

Based on the proposed Flood Response Programme, the following methodologies will be employed.

9.1.1.1. Hydrogeological Survey

i. Site Assessment and Desk Study

Existing borehole information from in-house database and previous studies conducted by the municipality within the defined project area will be assessed to compare yields, water levels and water quality in order to determine whether the aquifers are stable or deteriorating. Aerial photos and other data obtained from previous groundwater investigations will be studied and extrapolated to identify geological structures such as dykes, faults and lineaments that can be used for water balances sheet.

ii. Siting

The boreholes will be installed within the Towns/Villages indicated in Table 1 above. The appointed Service Provider will be required to use available and appropriate methods to site a borehole to ensure that it produces adequate yield. The decision to drill more than one borehole will depend on the yield of the first borehole. The location of boreholes, should more than one be required, must be at least 30-50 m away from a potential pollution source such as on-site toilets, cattle kraals or cemeteries, but as close to the village as possible.

iii. Hydro-census

Borehole verification within a 1 km radius of the identified location will be conducted to verify the use of groundwater in the area. Existing boreholes and springs in the defined areas will be the direction of groundwater in the area.

iv. Geophysical Investigation

A geophysical survey must be conducted to identify and accurately position any structural features and lithology changes which could influence groundwater movement. The geophysical survey to accurately define the positions of structural features, weathering zones and other features of significance to groundwater occurrence will comprise Electro Magnetic 34(EM-34) and magnetic profiling supported by Vertical Electrical Resistivity Soundings (VES) if required. The survey will assist in selecting sites for the drilling of groundwater boreholes.

A proton precision magnetometer (G-856 Memory-Mag.) manufactured by Geometrics will be used for the magnetic surveys as well as EM 34 manufactured by Geonic. The Magnetic and EM survey

method are useful in identifying intrusive dykes and geological contact zones. A station spacing of 10 m will be used during the survey. Data from the magnetic survey will be processed and presented as profiles using spread sheets (MS Office Excel).

The magnetic traversing will be done using a proton fluid magnetometer, the magnetic survey will be run in conjunction with the EM-34 survey.

v. Drilling Supervision/ Testing Supervision

The Hydrogeological service will include the supervision of the drilling and advise the municipality and CLIENT on the possibility of striking water of an expectable yield. Also included will be the supervision of the yield test to confirm the sustainable yield of the borehole.

vi. Drilling of Production Borehole

- Only one borehole will be equipped and be at least 165 mm in diameter. The municipality and client together with the Service Provider, to ensure and secure a sustainable yield borehole.
- A total of 350m of drilling will be accepted in order to strike water. This can potentially be spread over three boreholes, depending on whether water has been obtained or not. client together with the driller, will decide to stop drilling, and equip or move to the next site.
- The Drilling Contractor will only be paid for meters drilled and meters of casing installed in the borehole.
- All groundwater boreholes will be drilled in order to facilitate aquifer parameter testing and groundwater sampling. The borehole will be drilled using down the hole air percussion equipment.
- The drilling will be drilled according but not limited to the DWS minimum standards and guidelines:
 - a) The development of a production boreholes shall entail hydrogeological investigations, siting, drilling of new boreholes, and test pumping.
 - b) The Municipality and client will inform the service provider based on the yield test and water quality which borehole to equip.
 - c) The Borehole development shall further entail the removal of drilling fines from aquifer pores, removal of drilling foam/mud, and establishing a gravel pack filter around the borehole-aquifer interface.
 - d) Borehole development method for use shall be determined by the hydrogeological investigation's recommendations.
 - e) The Borehole diameter shall be determined by the findings of the hydrogeological investigations and site conditions, but not smaller than 165 mm.

- All installations shall make use of a solar electricity supply system and any alternate method of energy supply must be approved by the municipality and client. The selection of the solar pump type and capacity shall be based on:
 - a) Maximum required/available capacity and safe yield
 - b) Total pumping head
 - c) Maximum pumping rate feasible
- The borehole is to be fully screened (from the water table to bedrock) with a 0.5 m sump. A fine screen (5 mm long and 0.6 mm wide) is to be used to prevent sediment entry into the borehole and fine gravel pack is to be installed in the borehole annulus around the screen. The size of the gravel pack particles should be larger than slot/screen sizes. A bentonite pellet seal is to be installed above the depth at which the water table occurs. The borehole should be sleeved all the way.

9.1.1.4. Pump Test of the Production Borehole

Only the borehole agreed between the Municipality, client and the Driller, will be subjected to aquifer testing. This will be done with the aid of positive displacement pumps, and it will entail step drawdown test to determine borehole efficiencies and constant rate test to determine the aquifer parameters and yield estimates. It is anticipated that a 24 to 48-hour constant discharge tests will be done in the respective boreholes.

a) Step Tests

Step drawdown tests will be performed to more clearly define the optimum yield at which the constant discharge test can be run. The tests will involve pumping the agreed boreholes at four sequentially higher pumping rates each maintained for an equal length of time, generally not less than 60 minutes. The magnitude of drawdown of the water level in the borehole in response to each of these pumping rates will be measured and recorded on a time schedule as well as the actual pumping rate maintained during each step.

b) Constant Discharge Tests

Once the step drawdown tests have been completed the agreed borehole will be subjected to a constant discharge test over 24 to 48 hours in order to obtain aquifer parameters such as transmissivity and Distribution.

The constant discharge tests will be performed to assess the productivity of the aquifer according to its response to the abstraction of water. This response can be analyzed to provide information in regard to the hydraulic properties of the aquifer.

These tests will require the boreholes to be pumped at a single pumping rate which is kept constant for the duration of the test. The pumping rates will be set at yields which will be considered to be sustainable for the duration of the tests. The drawdown in water level in the boreholes will be measured during the course of the tests and recorded against a time schedule. Should there

be any boreholes within close proximity to pumped borehole, the drawdown in water level will be measured and recorded on the same time schedule as the pumped borehole. Water level measurements will be recorded during the recovery period following the end of pumping of the agreed borehole.

9.1.1.5. Borehole Water Sampling

A borehole water sample must be collected from the tested borehole at the end of pumping test exercise in order to obtain a representative elementary volume of the aquifer.

These samples must be submitted to an accredited analytical laboratory for the analyses of major cation and anion distribution, pH, electrical conductivity, total alkalinity and the water quality be classified according DWS Drinking Standards as well as SANS 241-1:2015.

9.1.1.6 Protecting Ground Water and Equipments

The site conditions and layout shall determine the feasible measures to be put in place to protect the groundwater from contamination and equipment from theft and damage.

The following guidelines shall be followed when determining the feasibility of protecting the borehole:

- The borehole and pump must be protected in a concrete ring and with a lockable manhole for inspections and to do Maintenance to the pump installation.
- The SOLAR installation should be protected against theft.
- The Tank stand with 2 X 5 000 l tanks should be protected against theft.
- SOLAR electrical equipment (inverter and batteries) must be stored in the equipment housing and should be protected against theft.
